

is blockchain tech too disruptive
to solve the identity problem?

there's the promise of digital
identity...

...and then there's the
reality

centralised...
inefficient...
broken...
friction...
surveillance...
fragmented...
inflexible...

enter the blockchain

identity:decentralised

terminology

physical body...

government record...

set of attributes...

username/password...

cryptographic keypair...

identity:bitcoin

but is this the identity
we need?

startups today

3rd parties:attestations

probabilistic

in public view

security, privacy, data
ownership...

business logic
(‘smart contracts’)

data certainty

smart oracles

transform interactions

state machine

real-time,
global ledger

profiles & actions

challenges ahead

<rewiring / commencing>

thanks!

any questions?
